

6. **MASS AND BALANCE**

Installation of the forward center of gravity limitation extension requires no change in the basic empty mass of the helicopter. However, when plotting loading points for center of gravity calculations use the diagram shown in this supplement (see Fig. 1).

7. **SYSTEM DESCRIPTION**

The longitudinal center of gravity limitation is extended 50 mm forward by installation of a modified cyclic control stop. This modified stop allows for an increased rearward movement of the cyclic stick. This requires that the forward adjustment stops in the seat rails of both pilot seats be repositioned aft to allow for complete freedom of movement of the cyclic stick.
