

5. PERFORMANCE DATA

No change in the basic Flight Manual data.

6. MASS AND BALANCE

6.1 EQUIPMENT LIST ENTRIES

System/Equipment Designation	Part No.	Mass (kg)	Arm (mm)	Massmoment (kgmm)
Rotor Brake System	105-10501	2.7	3500	9450
NOTE System mass does not include the reservoir oil (0.2 kg).				

7. SYSTEM DESCRIPTION

The rotor brake is designed to reduce turnaround time necessary for loading and servicing, and to prevent windmilling of the rotor system during gusty wind conditions. The rotor brake system comprises a brake lever assembly with integrated hydraulic master cylinder, a fluid reservoir with pressure relief valve, a brake actuator and a brake disc mounted on the transmission tail rotor drive output.

Pulling the brake lever (installed on the floor to the right of the pilot's seat) increases hydraulic pressure to the actuator causing internal pistons to force brake pads against both sides of the disc. The relief valve (mounted at the base of the reservoir located on the upper right side of the cabin bulkhead in the transmission compartment) prevents excessive pressure from being applied to the brake actuator.

The lever is ratchet locked in the highest position reached. Releasing the rotor brake is accomplished by pressing the thumb-button on the end of the brake lever and lowering the lever to its full down position.
